**SECTION-A**

**(READING)**

**A.1. Read the following passage carefully:**

**[10]**

Some animals move great distances at certain times of the year. This mass movement of animals from one place to another is known as migration. Animals migrate to escape harsh weather, to search for food and to reach their breeding grounds. Some birds like storks, Siberian Cranes and Mallard Ducks from other countries visit India every winter.

Migratory fishes like eels spend their lives in rivers. They travel from the river to the sea to lay eggs. When the eggs hatch, the parent eels die and the young ones travel back to the river from where the parents had started their journey.

Locusts are harmful migratory insects. Swarms of locusts settle on standing crops and destroy them. Many kinds of butterflies also migrate. The Monarch Butterflies fly from Canada to Mexico.

Migration is most common in birds. The Arctic Tern travels a distance nearly 35,000 km between the Arctic and the Antarctic twice a year. The European Stork travels from Europe to Africa every winter. When spring comes, it returns to Europe to the same nest. The Siberian Cranes nest in Western Siberia and migrate to India. Their migration route stretches to about 6450km. It is a great mystery. Migrating animals decide where to go and in which direction to fly. Some animals take help of the sea currents. The reindeers find their direction with the help of the sun's rays. And birds follow the coastline.
